## **NEUROLOGICAL SCIENCES COMMITTEE**

### **Aim**

To be able to tell the anatomical, histological and physiological information about the embryonic development, developmental anomalies and malformations of the nervous system, the structures and functions of the central nervous system, to be able to explain the clinical connections, to be aware of the deontology, basic concepts and professional rules

## **LEARNING OUTCOMES**

### **Knowledge Based**

#### ***To be able to:***

- explain legislation for the practice of the medical profession, basic knowledge of medicine, approaches to medicine, physician-patient relationship (evolutionary development and current situation, expected physician-patient relationship)
- list how the nervous system develops from germ layers during each week of development
- say the anatomical location of central nervous system structures
- describe the histological properties of central nervous system cells
- explain how the motor and sensory functions of the nervous system occur at the level of the medulla spinalis, brainstem and cortex
- count cranial nerves
- describe the histological and anatomical structure of the brain, tell the role of motor control and motor learning and related mechanisms
- describe the histological structure of spinal cord of medulla, describe descending pathways, define spinal reflexes
- describe eye anatomy and visual pathways, ear anatomy and hearing pathways, describe the physiological mechanisms of vision and hearing
- explain the autonomic nervous system
- explain the advanced functions of the nervous system, such as conditioned reflexes, learning and memory, with physiological mechanisms
- discuss the electrical properties of EEG and brain

### **Application Based (practical skills)**

- able to distinguish and show macroscopic and microscopic structures of the central nervous system
- can practise the anatomical structure of ear and eye
- must be able to distinguish the gray and white layers of the brain at microscope
- distinguish gray and white layers of medulla spinalis, front and rear horn on microscope
- must show physiological, histological features of eye and ear
- must be able to prepare decerebrate and spinal frog preparations. M. Spinalis reflexes should be shown on experiment animal
- can show various reflexes in man
- be able to distinguish reaction time and reflex time

### **Skills Based (intellectual and transferable skills)**

- be aware of the importance of cadaver use in anatomy education
- consider the role of microscopy in histology education
- be aware of the importance of ethical rules in the use of experimental animals and practices on human.
